                                                                                                                                                                                                                     The present invention relates to the isolation of Streptococcus pneumoniae 37kDa surface adhesin A protein, and the polynucleotide sequence encoding it. Also disclosed are antibodies to the 37kDa polypeptide, and methods of detecting the presence of S. pneumoniae sequences and methods are useful for preventing and treating S. pneumoniae infection. The present sequence represents a PCR primer pneumoniae serotype 6B gene.
                                                                                                                                                                                                                                                                                                                             Novel nucleic acid encoding Streptococcus pneumoniae 37-kDa surface adhesion A protein useful for preventing Streptococcus pneumoniae infection in subject.
                                                                                                                                                                                                   Sequence

Virions produced by expressing the viral genome of the chimeric plasmid are useful as positive controls in a test for detection of replication-competent retroviruses in preparations of MLV-GaLV-type retroviral vectors. For example, to ensure that the MLV-GaLV-type retroviral vectors, intended for gene therapy, have no capacity for replication. This polynucleotide sequence represents a primer used in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to late gestation lung (LGL) 1 polypeptides and encoding polynucleotides. The LGL1 polypeptides can be expressed by standard recombinant methodology. The LGL1 polypeptides, polynucleotides and modulators are useful for modulating lung disease, airway branching and/or abnormal alveolarization. The lung disease is bronchopulmonary dysplasia (BPD), emphysema, New BPD, chronic obstructive pulmonary disease (COPD); congenital diaphragmatic hernia (CDH), chronic bronchial infection, in a human with a deficiency of alpha-1-antitrypsin. The LGL1 polypeptide or polynucleotide is useful for the preparation of a medicament for use in the treatment of lung disease or disorder. They are useful in research, diagnostics and the preparation of therapeutics to creat diseases. The present sequence represents a primer used in RT-PCR amplification reactions of the rat LGL1 DNA
                                                                                                                                                                                                                                                                                                                     ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root;
blood; nerve; germ cell; food additive; food supplement.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel late gestation lung 1 polypeptide and lgll genes encoding the polypeptide, useful for preparing a medicament for use in the treatment
                         Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                  28-FEB-2002; 2002DE-01008794.

                                                                               CC comprise variable and non-variable regions. The capture oligonucleotides comprises variable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow CC binding of particularly locked nucleic acids (LAA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single cramaded nucleic acids to the surface is (quasi)covalent, supramolecular, cphysical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, thair root, blood, nerve or germ cells and (ii) for determining the catiff the method provides rapid, inexpensive and reproducible cacids (amino, carboxylic or fatty acid) or their derivatives, organic cacids (amino, carboxylic or fatty acid) or their derivatives, and call, and can lows imaging of the complete pattern of all nucleic acid in a cell, and can lows imaging of the complete pattern of all nucleic acid soil. Since the method of comparison of nucleic acid pools, not individual compense. Matrix miniaturisation is possible. AbX01281-AbX01344 represent constants and the nucleic acid pools.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, reading out, where the nucleic acids are selectively bound using capagents that are (a) immobilised on the surface of a solid matrix and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              8
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           cc reading out, where the nucleic acids are selectively bound using capture comprise variable and non-variable regions. The capture of a solid matrix and (b) comprise variable anchor region, the complement of which is present at (c) have a 5'-invariable anchor region, the complement of which is present at comprises all possible combinations of up to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow comprises as sequence of 10-50, particularly 15-25, T residues. The capture agents are particularly locked nucleic acids (INA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single cathad nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, acids trout, blood, nerve or germ cells and (ii) for determining the acids (acids (amino; carboxylic or fatty acid) or their derivatives, salts and captures. The method provides rapid, inexpensive and reproducible caids (anino; carboxylic or fatty acid) or their derivatives, salts and can detect very small differences in pools of nucleic acids from cells. It can detect very small differences in pools, not individual companies used in the method of the invention. Addividual capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

This invention describes a novel method for sorting single-stranded conveleic acids by isolation and hybridisation of nucleic acid pools, then creading out, where the nucleic acids are selectively bound using capture capture that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonuclectides have a 5'-invariable anchor region, the complement of which is present at comprise all possible combinations of up to 10 nucleotides to allow that comprises all possible combinations of up to 10 nucleotides to allow comprises a sequence of 10-50, particularly 15-25, T residues. The capture capture oligonuclectides are biotinylated and immobilised on a surface by interaction with streptevidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface stranded nucleic acids to the surface is (quasi) covalent, supramolecular, conducting properties and especially in the form of a chip. Its surface is paysical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, having semicatives or supplements, especially minerals, trace elements, organic activity of pharmaceuticals and/or nutritional compounds, e.g. food cativity of pharmaceuticals and/or nutrition

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow CC binding of particular sorts of single stranded nucleic acids. The capture agents are particularly locked nucleic acids (INA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semical particularly a layer of (bio)molecular filaments and binding of single conducting properties and especially in the form of a chip. Its surface by stranded nucleic acids to the surface is (quasi) covalent, supramolecular, CC physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the carific tell or fatty acid) or their derivatives, salts and CC additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC acids (amino, carboxylic or fatty acid) or their derivatives, salts and carlows inaging of the complete rapid, inexpensive and reproducible can detect very small differences in pools of nucleic acids from cells. It can detect very small differences in the nucleic acid pool. Since the can be complete acid pools, not individual companies matrix miniaturisation is possible. ```
This invention describes a novel method for sorting single-stranded concleic acids by isolation and hybridisation of nucleic acid pools, then comprise variable where the mucleic acids are selectively bound using capture cagents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The comprises a sequence of 10-50, particularly 15-25, T residues. The comprises a sequence of 10-50, particularly 15-25, T residues. The conducting properties are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, acids (amino, carboxylic or fatty acid) or their determining the criminal compounds, e.g. food cadditives or supplements, especially minerals, trace elements, organic caids (amino, carboxylic or fatty acid) or their derivatives, salts and conductine and steps of the comparison of nucleic acid sfrom cells. It can detect very small differences in pools of nucleic acid in a cell, and conductine sheet on comparison of nucleic acid pools, not individual capture probes used in the method of the invention.

                                                                                                                                                                                                                                                                S
                                                                                                                                                                                                                                                                                                                                                                                             CC least once in each nucleic acid and a 3'-variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture CC agents are particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-CC conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, activity of pharmaceuticals and/or nutritional compounds, e.g. food cadditives or supplements a crash/or nutritional compounds, e.g. food
                                                                                                                                                                                                                                                                                                                               Query Match

                                                                                                                                                                                                                                                                                                             Matches
                                                                                                                                                                                                                                                                                                                                                                                                                           activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, an can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel method for sorting single-stranded nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

This invention describes a novel method for sorting single-stranded conclusive acids by isolation and hybridisation of nucleic acid pools, then compared out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at cell least once in each nucleic acid and a 3'-variable, discriminatory region comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LMA) and the anchor region comprises a sequence of 10-50, particularly 15-23, T residues. The capture oligonucleotides are bottinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, comparises and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi)covalent, supramolecular, composited by an electrical field or through a molecular sieve. The method is used (1) for analysis of patterns, especially in mucosal, cardistives or supplements, especially minerals, trace elements, organic cardis (amino, carboxylic or fatty acid) or their derivatives, salts and cardistives. The method provides rapid, inexpensive and reproducible method is based on comparison of nucleic acid pool. Since the cardinal properties in the nucleic acid pool. Since the capture probes used in the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                 CC binding of particularly locked nucleic acids (LNA) and the anchor region CC agents are particularly locked nucleic acids (LNA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The CC capture oligonucleotides are biotinylated and immobilised on a surface by CC interaction with streptavidin. The matrix is of plastic, ceramic, glass, CC metal, resin, gel, crystalline material and/or membrane, having semi-CC conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single CC stranded nucleic acids to the surface is (quasi)covalent, supramolecular, CC physical, stimulated by an electrical field or through a molecular sieve. CC The method is used (1) for analysis of patterns, especially in mucosal, cartivity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and CC mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It can detect very small differences in the nucleic acids from cells, and CC method is based on comparison of nucleic acid pools, not individual CC capture probes used in the method of the invention.
                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at least once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root;
blood; nerve; germ cell; food additive; food supplement.

This invention describes a novel method for sorting single-stranded creading out, where the nucleic acids are selectively bound using capture cagants that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable and non-variable regions. The capture oligonucleotides chave a 5'-invariable anchor region, the complement of which is present at cleast once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particulary locked nucleic acids (IAA) and the anchor region comprises as sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, metal, resin, gel, crystalline material and/or membrane, having semiconducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface liquasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, having semicativity of pharmaceuticals and/or nutritional compounds, e.g. food acids (amino, carboxylic or fatty acid) or their determining the acids (amino, carboxylic or fatty acid) or their determining the cardis (amino, carboxylic or fatty acid) or their determining the cardis (amino, carboxylic or fatty acid) or their derivatives, salts and cardis (amino, carboxylic or fatty acid) or their derivatives, salts and cardis (amino, carboxylic or fatty acid) or their derivatives, salts and cardis in a delia. It cardis to the supramolecular acids from cells. It cardis of the comparison of nucleic acid pools, since the method is based on comparison of nucleic acid pools, since the method of the comparison of nucleic acid pools, not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable and constant regions.

CC have a 5'-invariable anchor region, the complement of which is present at Cleast once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The capture agents are particularly locked nucleic acids (INNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture coigonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The material and/or membrane, having semicontail the surface acids (INNA) and the anchor region conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, that root, blood, nerve or garm cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food activity of pharmaceuticals and/or nutritional compounds, e.g. food cadditives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and captures in material differences in pools of nucleic acid in a cell, and captures of the complete acid pool. Since the method is based on comparison of nucleic acid pools, since the method is net in the method of the howeled acid pools. ADK01344 represent compares native and the method of the howeled acid pools.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nucleic acids by isolation and hybridisation of nucleic acid pools, then reading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ss; hybridisation; capture oligonucleotide; pattern; mucosal; hair root;

                                                          This invention describes a novel method for sorting single-stranded cc nucleic acids by isolation and hybridisation of nucleic acid pools, then creading out, where the nucleic acids are selectively bound using capture agents that are (a) immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides have a 5'-invariable anchor region, the complement of which is present at cleast once in each nucleic acid and a 3'-variable, discriminatory region that comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture oligonucleotides are binding is stranded nucleic acids. The capture comprises a sequence of 10-50, particularly 15-25, T residues. The computes are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, crystalline material and/or membrane, having semi-cc is particularly alayer of (bio)molecular filments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, cylong the matrix and particular filments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, cylong the matrix and/or nutritional compounds, e.g. food acids (amino, carboxylic or fatty acid) or their derivatives, salts and cylong the matrix and/or nutritional compounds, e.g. food acids (amino, carboxylic or fatty acid) or their derivatives, salts and cylong the matrix miniatures and reproducible and (ii) for acids from calls. It compounds the material and/or nutritional acids from calls. It can be acid to a compound of the compounds of nucleic acid pools, since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 吊
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               S
CC This invention describes a novel method for sorting single-stranded CC nucleic acids by isolation and hybridisation of nucleic acid gools, then CC reading out, where the nucleic acids are selectively bound using capture cC agents that are (a) immobilised on the surface of a solid matrix and (b) CC comprise variable and non-variable regions. The capture oligonucleotides CC have a 5'-invariable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region CC that comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids (LUA) and the anchor region CC comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by interaction with streptavidin. The matrix is of plastic, creamic, glass, conducting properties and especially in the form of a chip. Its surface is particularly a layer of (bio) molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, physical, stimulated by an electrical field or through a molecular sieve. CC The method is used (i) for analysis of patterns, especially in mucosal, physical, stimulated by an electrical field or through a molecular sieve. CC hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic crids (amino, carboxylic or fatty acid) or their derivatives, salts and conjunction of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, and can detect very small differences in the nucleic acid sold. Since the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sorting single-stranded nucleic acid, useful for analyzing expression patterns and screening active agents, uses capture agent with variable

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ន្តន្តន្តន្ត
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Ś
CC reading out, where the nucleic acids are selectively bound using capture capents that are (a) immobilised on the surface of a solid matrix and (b) CC comprise variable and non-variable regions. The capture oligonucleotides cCC have a 5'-invariable anchor region, the complement of which is present at CC chart comprises all possible combinations of up to 10 nucleotides to binding of particular sorts of single stranded nucleic acids. The capture cC agents are particularly locked nucleic acids (LNA) and the anchor region cC capture oligonucleotides are biotinylated and immobilised on a surface by citeraction with streptavidin. The matrix is of plastic, ceramic, glass, cc and the groperties and especially in the form of a chip. Its surface cc is particularly a layer of (bio)molecular filaments and binding of single stranded nucleic acids to the surface is (quasi) covalent, supramolecular, cphysical, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal, thair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals anal/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements, organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, a can detect very small differences in the nucleic acid pool. Since the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent
capture probes used in the method of the invention.

PF 28-PEB. This invention describes a novel method for sorting single-stranded connected acids by isolation and hybridisation of nucleic acid pools, then concern acid pools, then concern acid pool immobilised on the surface of a solid matrix and (b) comprise variable and non-variable regions. The capture oligonucleotides comprise variable and non-variable regions. The capture oligonucleotides comprise one in each nucleic acid and a 3'-variable, discriminatory region contact comprises all possible combinations of up to 10 nucleotides to allow binding of particular sorts of single stranded nucleic acids. The capture cagents are particularly locked nucleic acids (LNA) and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilized on a surface by interaction with streptavidin. The matrix is of plastic, ceramic, glass, conducting properties and especially in the form of a chip. Its surface is particularly, stimulated by an electrical field or through a molecular sieve. The method is used (i) for analysis of patterns, especially in mucosal,

XX DE10208 This invention describes a novel method for sorting single-stranded comucleic acids by isolation and hybridisation of nucleic acid pools, then correctly where the nucleic acids are selectively bound using capture comprise variable and non-variable regions. The capture oligonuclectides comprise variable and non-variable regions. The capture oligonuclectides comprise variable anchor region, the complement of which is present at CC least once in each nucleic acid and a 3'-variable, discriminatory region comprises all possible combinations of up to 10 nucleotides to allow binding of particularly locked nucleic acids fully and the anchor region comprises a sequence of 10-50, particularly 15-25, T residues. The capture oligonucleotides are biotinylated and immobilised on a surface by conducting properties and especially in the form of a chip. Its surface conducting properties and especially in the form of a chip. Its surface

The method is used (i) for analysis of patterns, especially in mucosal, hair root, blood, nerve or germ cells and (ii) for determining the activity of pharmaceuticals and/or nutritional compounds, e.g. food additives or supplements, especially minerals, trace elements organic acids (amino, carboxylic or fatty acid) or their derivatives, salts and mixtures. The method provides rapid, inexpensive and reproducible representation of differences in pools of nucleic acids from cells. It allows imaging of the complete pattern of all nucleic acid in a cell, and can detect very small differences in the nucleic acid pools, ince the method is based on comparison of nucleic acid pools, not individual genes, matrix miniaturisation is possible. ADK01281-ADK01344 represent capture probes used in the method of the invention.
                          modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of
                                                                                                                                                                                                                                                                                                                                                                                        Analysis of chemical modification of DNA involves obtaining sample of DNA to be analyzed, treating DNA with chemical reagents that result in
                                                                                                                                                                                                                         This invention relates to a novel method for analysing chemically

                                                                                      This invention relates to a novel method for analysing chemically modified macromolecules. Specifically, it refers to a high throughput method for the parallel analysis of many potential sites of chemical modification (e.g. methylation) in DNA. The present invention describes treating the DNA with one or more chemical reagents that result in different base sequences depending upon the presence or absence of the modification of interest. Accordingly, a device comprising an array of probes is provided to hybridise with and select the altered DNA sequences that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines H69 and H1618. This oligonucleotide sequence is a human DNA probe used to immobilise CpG methylated DNA of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               that comprise the modifications of interest such as a CpG island. In particular, this invention refers to analysing the methylation pattern of a region of the promoter for the tumour suppressor gene pl6 from two human lung tumour cell lines H69 and H1618. CC comprising oligonuclectides, effective for alleviating CC bronchoconstriction, respiratory tract inflammation, allergies and CC reducing adenosine sensitivity, levels of adenosine (A) or (A) receptors, CC surfactant depletion or hyposecretion, when administered to a mammal. The Coligonuclectides are derived from a gene encoding or regulating CC expression of a target polypeptide associated with lung airway or lung CC dysfunction or cancer and can be anti-sense to the corresponding mRNA. CC The invention also describes a kit, that comprises: (a) a delivery CC device, in separate containers, (b) the oligonuclectides, (c) instructions for adding a carrier and for use of the kit. The composition CC of the invention has antiallargic, antiinflammatory, antiasthmatic, and gesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or CC treating a respiratory, lung or malignant disease. The administered correduce the production or availability, or to increase the degradation of the target mRNA or to reduce the amount of target polypeptide present in the lungs. The composition control of the carget mRNA or to inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  문

នន្តន្តន្តន្តន្តន្តន្
                                                   distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymiddines present in the target NNA serves to prevent the breakdown of the oligonucleotides into products that free adenosine into the system e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, trevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                       inflammation, allergies, asthma, impeded respiration, respiratory
                                                                                                                                                                                                                                 pulmonary
                                                                                          6

Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted to nucleic goids associated with lung airway or lung dysfunction, and bronchodilating agent.

Claim 15; SEQ ID NO 4919; 763pp; English

This invention describes a novel composition (a) a first active agent, comprising oligonucleotides, effective for alleviating bronchoconstriction, respiratory tract inflammation, allergies and reducing adenosine sensitivity, levels of adenosine (A) or (A) receptor surfactant depletion or hyposecretion, when administered to a mammal. I oligonucleotides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery (A) receptors,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CC device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition CC of the invention has antiallergic, antiinflammatory, antiasthmatic, CC analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or CC treating a respiratory, lung or malignant disease. The administered CC composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to CC reduce the amount of target polypeptide present in the lungs. The CC pulmonary obstruction, and/or bronchoconstriction and/or lung CC inflammation, allergies and/or surfactant hypoproduction are associated with a disease or condition such as pulmonary vasoconstriction, cc inflammation, allergies, asthma, impeded respiration, respiratory CC distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary transplantation repetction, pulmonary infections, bronchitis or cancer. CC the reduced adenosine content of the anti-sense oligos corresponding to the oligonacteotides into products that free adenosine into the system CC e.g., lung, brain, heart, kidney, etc, tissue environment and thereby, to prevent any unwanted effects due to it
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Best Local Similarity

                                                     The present invention relates to a polynucleotide isolated from a human gene and is useful for detecting a single nucleotide polymorphism in a human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to a polymucleotide isolated from a gene and is useful for detecting a single nucleotide polymorphism human gene or for diagnosing of disease. The invention enables the detection of a single nucleotide polymorphism in a human gene. The present sequence represents a primer of the invention.

                           New polypeptides and nucleic acids, useful for diagnosing, treating preventing liver disorder (e.g. cirrhosis, alcoholic liver disease, chronic hepatitis), or epithelial cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The invention relates to a novel intercalator having a specific formula. The intercalator of the invention may be useful for the electrochemical detection of a gene, as an electrochemical double stranded DNA detection reagent and as an intercalator for inhibiting the influence of mismatch DNA and single stranded DNA. The intercalator enables the transmission of electronic transition between two base pairs to occur efficiently. The current sequence is that of the electrochemical detection intercalator-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ss; primer; hepatotropic; cytostatic; gene therapy; liver disorde epithelial cancer; cirrhosis; alcoholic liver disease; hepatitis; Wilson's Disease; heamochromatosis; hepatocellular carcinoma; benign liver neoplasm; focal nodular hyperplasia; adenocarcinoma.
                                                                                                                                                                                                                                                                                            27-SEP-2002;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the isolation of polypeptides and their encoding genes which are associated with liver disorders and epithelial cancers. The polypeptides, nucleic acids, molecules and compositions are useful for disgnosing, treating or preventing liver disorder (e.g. cirrhosis, alcoholic liver disease, chronic hepatitis, Wilson's Disease, heamochromatosis, hepatocellular carcinoma, benign liver neoplasms, and focal nodular hyperplasia), or epithelial cancer, which is an adenocarcinoma of the lung, the stomach, the kidney, the colon, the prostate, the skin, and the breast. This sequence represents an oligonucleotide associated with the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          US2004067490-A1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      01-JUL-2004 (first entry)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence

                                                                        The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Nlzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                     Zhong M, Li L, Gorman L, Spytek KA, Kekuda R, Taupier RJ;

                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obserty, infectious diseases, anorexia, cancer, encoredgenerative disorders, Albeimer's diseases, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Zhong M, Li L, Gorman L, Spytek KA, Kekuda R, Taupier RJ; Anderson DW, Vernet CAM, Catterton E, Miller CE, Shenoy SG, Patturajan M, Pena CEA, Tchernev VT, Padigaru M, Gusev VY; Malyankar UM, Burgess CE, Gerlach V, Casman SJ, Rieger DK; Grosse WM, Smithson G, Peyman JA, Starling G, Rothenberg MK Larochelle WJ, Shimkets RA, Crabtree J, Rastelli L, Voss EZ Boldog FL, Edinger SR, Millet I, Macdougall JR, Ellerman K,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, amorexia, cancer, neurodegenerative disorders, Alzheimer's diseases, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; NOVX; as; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer; neurodegenerative disorder; Alzhelmer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; antidiabetic; anorectic; antimicrobial;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New isolated polypeptide, useful for treating or preventing a pathology associated with the polypeptide, e.g. diabetes, infectious disease, cancer, neurodegenerative disorders or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Zhong M.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polymucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Human; NOVX; ss; metabolic disorder; diabetes; obesity; infectious disease; anorexia; cancer; neurodegenerative disorder; Alzheimer's disease; Parkinson's disease; immune disorder; haematopoietic disorder; antidiabetic; anorectic; antimicrobial; anabolic; eating disorder; cytostatic; neuroprotective; nootropic; antiparkinsonian; antianaemic; probe.

                                                                                                                                                                                                  The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's diseases, parkinson's diseases, immune disorders and hasmatopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated polypeptide, useful for treating or preventing a pathology associated with the polypeptide, e.g. diabetes, infectious disease, cancer, neurodegenerative disorders or Alzheimer's disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Zhong M, Li L, Gorman L, Spytek KA, Kekuda R, Taupier RJ;

                                                                                Query Match
                                                                                                                                  The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's diseases, Parkinson's diseases, immune disorders and haematopoietic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                             Zhong M, Li L, Gorman L, Spytek KA, Kekuda R, Taupier RJ;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to human NOVX polypeptides and polynucleotides. The isolated nucleic acids can be used to express the novel proteins, to detect novel mRNA or a genetic lesion in a novel gene and to modulate its activity. It can also be used in gene therapy for treating or preventing a pathology associated with the protein or nucleic acid. The disorders include metabolic disorders, diabetes, obesity, infectious diseases, anorexia, cancer, neurodegenerative disorders, Alzheimer's diseases, Parkinson's diseases, immune disorders and haematopoletic disorders. This sequence represents a probe used in analysis of expression of a human NOVX polynucleotide of the invention.
                                                                                                                                                                                                     Wohlgemuth Rosenberg S
                         Diagnosing or monitoring transplant rejection, pancreas, pancreatic islet, lung, bone marrow c rejection, in an individual, comprises detectir the genes.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic slet, lung, bone marrow or stem cell transplant rejection, in a individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lungs, inflammatory bowel diseases, multiple sclerosis, HTV/AIDS or viral, bacterial or fungal infection. The present sequence represents a probe for a 50 mer oligonuclectide marker for diagnosis and monitoring o
                                                         The invention comprises oligonucleotides that detect polymorphisms within the pig KIT gene. The oligonucleotides of the invention may also detect polymorphisms within the pig melanocyte stimulating hormone-receptor (MCIR) gene. The oligonucleotides of the invention are useful for discriminating a variety of pig. The present DNA sequence represents a capture oligonucleotide that was used in an example of the invention.
                                                                                                                                                                                                                                                                                                                                                      Oligonucleotide, useful for discriminating between varieties of pig by detecting specific polymorphisms of KIT and melanocyte stimulating hormone-receptor (MCIR) gene by hybridizing capture oligonucleotides and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 pig; porcine; polymorphism detection; KIT gene;

                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to a novel method for extracting a nucleic acid or protein using a dendrimer having an amino group. The multilayer dendrimer is generated on the surface of a microparticle and displays a number of amino groups on its outer surface. The method of the invention may be useful for extracting a nucleic acid or protein. The current sequence is that of the PCR primer 1 of the invention which was used to amplify DNA from a human blood sample.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This oligonucleotide comprises a forward primer sequence for novel sequence tagged site (STS) D135Kk14. It produces a 78 bp amplicon when used with a D135Kk14 reverse primer (see AAT74240). Novel STS were isolated from murine beige (bg) critical region yeast artificial chromosomes by interspersed repetitive element (IRB)-PCR (D135Kk1-D135Kk1) or by direct selection (D135Kk1-D135Kk1). Characterisation of the bg critical region in murine chromosome 13 and positional cloning of bg were performed as an antecedent to identification of the homologous human gene LYST1 (see AAT74201), which is mutated in human Chediak-
                                                                                                  Enzymatic and antisense nucleic acid inhibition of repressor useful for producing e.g. granulocyte colony stimulating fact interferon alpha and erythropoletin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       AAF05468 standard; DNA; 17 BP

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TR-1, the GATA transcription factor gene, IRF-2 and/or the CAATI Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor protein and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      25-MAY-2001; 2001WO-US016981
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            06-DEC-2001
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Homo sapiens

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    and/or amount specifically of hgDMLP proteins, as specific biomolecule capture probes for surface-enhanced laser description ionisation, as therapeutic supplement in patients having specific deficiency in hGDMLP-1 production, and in vaccines or for replacement therapy. The polynucleotide sequences encoding hGDMLP-1 may be used for diagnosing a disorder associated with the expression of hGDMLP-1, in particular heart and skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleic acids can be used as probes to detect, characterise and quantify hGDMLP-1 nucleic acids in samples, as amplification substrates, to provide initial substrates for the recombinant engineering of hGDMLP-1 protein variants having desired phenotypic improvements, and for expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 proteins, as standards in assays used to determine the concentration of the concentration and the concentration of the concentration 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human; genome-derived myosin-like protein 1; GDMLP-1; muscle; myosin; chromosome 22; gene therapy; vaccine; skeletal muscle disorder; amplicon; screening; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes a human genome-derived myosin-like CC protein 1 (hGpMLP-1). The protein and polynucleotide sequences of hGDMLP-CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1 CC nucleic acids can be used as probes to detect, characterise and quantify CC provide initial substrates for the recombinant engineering of hGDMLP-1 CC protein variants having desired phenotypic improvements, and for CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be used as immunogens to raise antibodies that specifically recognise hGDMLP-1 cc expressing the proteins. The hGDMLP-1 proteins or polypeptides may be consentration as standards in assays used to determine the concentration cc and/or amount specifically of hGDMLP proteins, as specific biomolecule capture proteins for surface-enhanced laser desorption ionisation, as ctherapeutic supplement in patients having specific deficiency in hGDMLP-1 capture proteide sequences encoding hGDMLP-1 may be used for diagnosing a CC disorder associated with the expression of hGDMLP-1, in particular heart cand skeletal muscle disorders. hGDMLP-1 is localised to chromosome 22. The present sequence represents an oligomer used in the screening of the hGDMLP-1 sequence in the exemplification of the present invention. N.B. CC fightle-1 sequence for this patent did not form part of the printed cc specification, but was obtained in electronic format directly from WIPO CC at fightle-1 but was obtained in electronic format directly from WIPO CC at fightle-1 heavis obtained in electronic format directly from WIPO cc at fightle-1 capture described by the printed consensation of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Matches

CC protein 1 (hGDMLP-1). The protein and polynucleotide sequences of hGDMLP-CC 1 can be used in gene therapy and vaccine production. The hGDMLP-1 CC nucleic acids can be used as probes to detect, characterise and quantify CC hGDMLP-1 nucleic acids in samples, as amplification substrates, to CC protein variants having desired phenotypic improvements, and for CC expressing the proteins. The hGDMLP-1 proteins or polypeptides may be CC used as immunogens to raise antibodies that specifically recognise hGDMLP CC used as immunogens to raise antibodies that specific biomolecule capture probes for surface-enhanced laser desorption ionisation, as the characteristically of hGDMLP proteins, as specific biomolecule computer probes for surface-enhanced laser desorption ionisation, as the characteristic production, and in vaccines or for replacement therapy. The production, and in vaccines or for replacement therapy. The collapse speciated with the expression of hGDMLP-1 may be used for diagnosing a CC disorder associated with the expression of hGDMLP-1, in particular heart cf he present sequence in the expression of the present invention. N.B. CC may be used for this patent did not form part of the printed content on the screening of the specification, but was obtained in electronic format directly from WIPO as fer fer wino 1417/nublished for femence.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        뭐
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      acid, where the oligonucleotide binds in a parallel and antiparallel corientation, respectively, to traget sequences on alternate strands of the double helical nucleic acid. The method has therapeutic applications, where gene expression is controlled by selective triple-helix formation within expression regulatory sequences of a target gene. The oligonucleotides can be used to form triple-helices, and are useful to controlled by participations and are useful to detect the presence or absence of specific sequences within genomic DNA for diagnostic and therapeutic purposes. The oligonucleotides can be selected to specifically bind to pathogenic double-stranded DNA including specific sequences required by pathogenic bacteria or viruses for the oligonucleotide can be chosen to target a unique sequence of the pathogen which is not found in the genome of pathogen's host. The pathogen which is not found in the genome of pathogen's host. The pathogen which is not found in the genome of pathogen's host. The pathogen which is not found in the genome of pathogen's host. The pathogen which is not found in the genome of pathogen's host. The pathogen which is not found in the genome of pathogen's host. The pathogen which is not found in the genome of pathogen's host. The pathogen with such sequences in cancer our capable of forming triple-helix origin. Such therapeutic oligonucleotides are capable of forming triple-helices with such sequences in cancerous cells containing the activated oncogene, so preferentially killing or repressing the cancer causing cell. The present sequence represents an oligonucleotide used in the methods of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Best Loca

                                                                                                                                     S
                                                                                                                                                                                                                                                                 cc incleotides, a sequence that hybridizes under stringent conditions with concludes. The nucleotides are used as probes or primers for detecting, concludes. The nucleotides are used as probes or primers for detecting, concludes and untifying and/or amplifying nucleic acids, as in vitro sense and antisense sequences, of nucleotides involved in tumour suppression or reversion, apoptosis and or viral resistance, to produce recombinant polypeptides, and to prepare transgenic animals, as experimental models. The nucleotides (also vectors containing them and comparison to the polypeptides and to prepare transgenic animals, as experiments the polypeptide are useful for prevention and/or treatment of viral infections or diseases characterized by development of tumours or cell degeneration (e.g. Alzheimer's disease or schizophrenia).

Chalysis of the expression of the nucleotides can be used for diagnosis of these diseases. The nucleotides and polypeptides can also be used to screen for their specific interactive molecules, potentially useful for treating diseases associated with abnormal
                                                                                                                                                                                   Matches
                                                                                                                                                                                                                     Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to the isolation of 6377 nucleotide sequences, rragments of at least 15 consecutive nucleotides of these nucleotides, sequence having at least 80% identity, after optimal alignment, with the nucleotides, a sequence that hybridizes under stringent conditions with
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid encoding human prostate membrane-specific antigen, useful e.g. for treatment of tumors and viral infection, also related polypeptide and antibodies.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         in the phenomena of tumour suppression, tumour reversion, apoptosis and/or resistance to viruses. The invention may be useful for the development of compounds with a cytostatic, virucide, neuroprotective, nootropic or neuroleptic activity. The DNA sequences may be useful as probes and primers for detecting, indentifying, quantifying and/or amplifying nucleic acid, for example as one component of a gene chip, in vitro as antisense reagents and for production of recombinant polypeptides. The invention may therefore be useful for preparation of polypeptides. The invention and/or treatment of viral diseases that are characterised by development of tumours or cell degeneration, specifically cancer but also Alzheimer's disease and schizophrenia. The present sequence is that of a nucleic acid sequence of the invention.

Note: The sequence data for this pattent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at figure in the publishedpct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes phosphorothioate antisense oligonucleotides that are targeted to the 3'-untranslated region (UTR) of the sequence encoding a human dual specificity protein phosphatase designated PTEN (also known as MMAC1 and TEP1), and hybridise specifically to the human PTEN nucleotide sequence given in AAS91361. The antisense oligonucleotides have anticancer, anti-inflammatory and anti-infective activities. The phosphorothioate antisense oligonucleotides can be used for diagnosis, treatment and prevention of PTEN-related diseases, e.g. infections, inflammation and tumours. The present sequence represents a phosphorothioate antisense oligonucleotide for human PTEN, from the present invention
                                                                                                       Substrate for detecting helicase activity in a UL9 protein, comprises strand including a herpes replication origin sequence and another straincluding a complementary sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         07-DEC-2000

The UL9 substrates are use for detecting UL9 helicase activity in combination with ICP8 and ATP also for detecting the ability of a chemical entity to inhibit UL9 helicase activity. Immobilised UL9 substrate is useful for detecting herpes infected samples. AAA87951 to AAA87967 represent specifically claimed herpes replication origin sequences given in the present
                                                                      New antisense oligonucleotides targeting nucleic acids encoding PTEN, useful for treating diabetes, increasing insulin sensitivity, or decreasing insulin resistance, blood triglyceride or cholesterol levels
                                                                                                                                                                                                                                                                                                                         21-JUL-1999;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a compound targeted to a nucleic acid encoding PTEN (a dual specificity protein phosphatase), where the compound is an antisense oligonucleotide. The antisense oligonucleotides are useful in modulating the function of nucleic acids encoding PTEN, ultimately modulating the amount of PTEN produced. The antisense compounds can used as diagnostics, therapeutics, prophylactics (e.g. to prevent or delay infection, inflammation or tumour formation), and as research agents and kits. The antisense compounds are also useful in treating diabetes, decreasing insulin resistance, increasing insulin sensitivity and decreasing blood triglyceride or cholesterol levels in a diabetic animal. The present sequence is an antisense oligonucleotide targetting the DNA encoding PTEN (also known as MMACI/TEP1)
                                                                                                                                                                                                                                                                                                                                                                                                                            Human; phosphoinositide phosphatase; PTEN; liver; kidney; cholesterol; metabolic disease; diabetes; hyperproliferative; glucose; insulin; PEP triglyceride; antisense gene therapy; cytostatic; adipose cell; antiproliferative; antisense; phosphorothicate backbone; ss.
